

# Encoder for live video streams

**Teracue**

By Anne Morris

A new lightweight portable encoder for live streaming applications is being exhibited by Teracue. The ENC-300 is designed for live streaming applications where single TV channels, camera signals or monitoring feeds are distributed or published on a network or the internet.

The new launch is a compact, low-cost H.264 SD/HD video encoding and live streaming blade.

The ENC-300-HDSDI encoder processes input streams from CIF up to Full-HD resolution for professional MPEG-4 AVC H.264 SD/HD streaming to any kind of device.

The ENC series provides realtime compression of video and audio inputs. The devices create and transmit video streams through LAN, WLAN and UMTS networks. Users can input video/audio

signals on an ENC encoder and view these streams on PCs, TVs or mobile devices. **13.423**
